VICTOR INSULATORS, INC.

The original insulator manufacturer in North America

Company Information

Company History

Victor Insulators, Inc. was founded in 1894 by Fred M. Locke. Fred Locke was one of the great early contributors to the successful establishment and growth of the electric power industry in North America. In 1894 he developed and patented a process for manufacturing wet process porcelain for use in insulators for power lines. His accomplishment was in no small way a key contribution to the eventual growth of the electric power industry. Prior to Fred's accomplishments, insulators were at best unreliable for the demands of this growing industry.

Although the company that Fred Locke established in Victor NY has changed names over the years, Victor Insulators, Inc. is the direct successor to the operation that he began over 100 years ago. For a "time line" of the wet process insulator manufacturing industry in the USA, see below.

Today, Victor is a privately held (employee owned) company dedicated to the same ideals that have been successful since 1894. Our commitment to quality, service and competitive pricing continues to make us the preferred supplier of insulators.

VICTOR INSULATORS, INC.

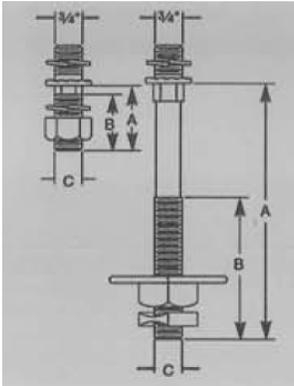

The original insulator manufacturer in North America

Line Post Hardware

Mounting Studs

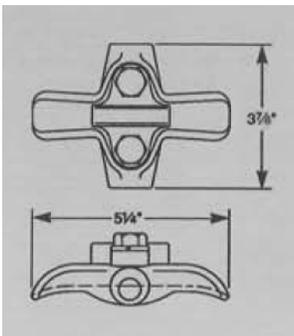

Mounting studs are available at an additional cost. Victor Insulators' studs can be used with all other manufacturers' line posts that meet ANSI standards

72091	Wood	13.2-23	7	4	5/8	1.25

Clamps

Victor Insulators' yoke design will accept other manufacturer's clamps with a standard nominal 4" trunnion. Conductor clamps have been designed with reversible keepers, so that three designs of clamps will accommodate conductors ranging from .25" to 1.5" in diameter. Victor Insulators' clamps will fit any 4" spaced yoke of either vertical or horizontal design.

VICTOR INSULATORS, INC.

The original insulator manufacturer in North America

Polymer Insulators Introduction

Polymer insulators are significantly lighter than porcelain or glass insulators of the same voltage rating. This makes them easier to handle during installation and maintenance. The fiberglass rod used in polymer insulators give them high mechanical strength, allowing them to withstand the mechanical stresses imposed by wind, ice, and other environmental factors. Polymer insulators provide effective electrical insulation, preventing current leakage and flashovers even in challenging weather conditions. They have a high resistance to electrical tracking and arcing. Unlike porcelain insulators, polymer insulators are not susceptible to corrosion, making them suitable for use in harsh environments, such as coastal areas with high salt content in the air.

Polymer insulators have a hydrophobic surface, which means they repel water. This property helps prevent the accumulation of contaminants and pollutants on the insulator's surface, reducing the risk of flashovers. The smooth surface of polymer insulators is easy to clean, and they often require less maintenance compared to porcelain insulators.

Polymer transmission insulators have become a popular choice for many electrical utilities due to their durability, lightweight nature, and resistance to environmental factors.

The original insulator manufacturer in North America

Polymer Distribution Insulators

Polymer distribution insulators come in various designs to suit different applications within power distribution systems. Here are a few specific types of polymer distribution insulators:

Deadend Insulators: Deadend insulators are used at the ends of overhead power lines to terminate the conductor and provide insulation and support. They prevent the power line from continuing beyond a specific point. These insulators are essential for securing the conductor and ensuring electrical isolation.

Line Posts Insulators: Line post insulators are used to support power lines along their length. They are typically mounted on crossarms, brackets, or other structures and help maintain the conductor's distance from the ground and other objects. Line post insulators are commonly used in distribution and sub transmission lines.

Vertical Posts Insulators: Vertical post insulators, also known as suspension insulators, are designed to hang the power line conductors vertically. They provide both mechanical support and electrical insulation. These insulators are often used in transmission lines to handle the weight of long spans of conductors.

Universal Clamp Posts: Universal clamp post insulators are versatile insulators that can serve multiple purposes, such as providing support for conductors, acting as line spacers, or serving as deadend terminations. They are designed to accommodate various hardware and mounting configurations, making them suitable for different line applications.

Polymer Station Posts

Guaranteed lifetime performance

Polymer station posts are used for various applications within substations to support and insulate electrical equipment and conductors. These posts offer several advantages over traditional materials like porcelain or glass, including lightweight construction, high mechanical strength, resistance to environmental factors, and improved performance.

Some of the key features of polymer station posts are:

- **Lightweight:** Polymer posts are significantly lighter than their porcelain or glass counterparts, making them easier to transport, install, and handle.
- **High Mechanical Strength:** They have high mechanical strength, which allows them to withstand various mechanical stresses, such as wind loads and vibrations, without breaking.
- **Corrosion Resistance:** Polymer insulators are resistant to environmental factors like moisture and UV radiation, reducing the risk of degradation over time.
- **Improved Pollution Performance:** They exhibit excellent pollution performance, making them suitable for substations located in polluted or coastal areas.
- **Low Maintenance:** Polymer posts require minimal maintenance compared to traditional materials, reducing overall operational costs.
- **Long Service Life:** These insulators can have a long service life, which can be an advantage in critical electrical infrastructure.
- **Versatility:** Polymer insulators come in various shapes and sizes, making them adaptable for different applications within the substation.

Polymer Transmission

Guaranteed lifetime performance

Polymer transmission insulators are a type of electrical insulator used in high-voltage transmission and distribution systems to support and insulate overhead power lines. These insulators are made from polymer materials, typically reinforced with fiberglass or other strengthening components, and they offer several advantages over traditional porcelain or glass insulators.

Some of the key features of polymer transmission insulators are:

- Lightweight: Polymer insulators are significantly lighter than porcelain or glass insulators of the same voltage rating. This makes them easier to handle during installation and maintenance.
- High Strength: The fiberglass or other reinforcing materials used in polymer insulators give them high mechanical strength, allowing them to withstand the mechanical stresses imposed by wind, ice, and other environmental factors.
- Corrosion Resistance: Unlike porcelain insulators, polymer insulators are not susceptible to corrosion, making them suitable for use in harsh environments, such as coastal areas with high salt content in the air.
- Hydrophobic Properties: Most polymer insulators have a hydrophobic surface, which means they repel water. This property helps prevent the accumulation of contaminants and pollutants on the insulator's surface, reducing the risk of flashovers.
- Customizable Design: Manufacturers can tailor the design and color of polymer insulators to meet specific aesthetic and environmental requirements.

VICTOR INSULATORS, INC.
The original insulator manufacturer in North America

Polymer Suspensions *Guaranteed lifetime performance*

- Exceeds ANSI and IEC electrical and mechanical requirements
- Made with high quality hydrophobic silicone polymer
- Tested according to ANSI C29.12 Standards

69 kV Suspension Product Line

VICTOR INSULATORS, INC.

The original insulator manufacturer in North America

Polymer Guy Strains *Guaranteed lifetime performance*

- Lightweight for easy installation
- Field tested and proven performance
- Does not shatter, impact resistant
- Silicone coating provides greater protection
- Many configurations available

Polymer Guy Strain Product Line

VICTOR INSULATORS, INC.
The original insulator manufacturer in North America

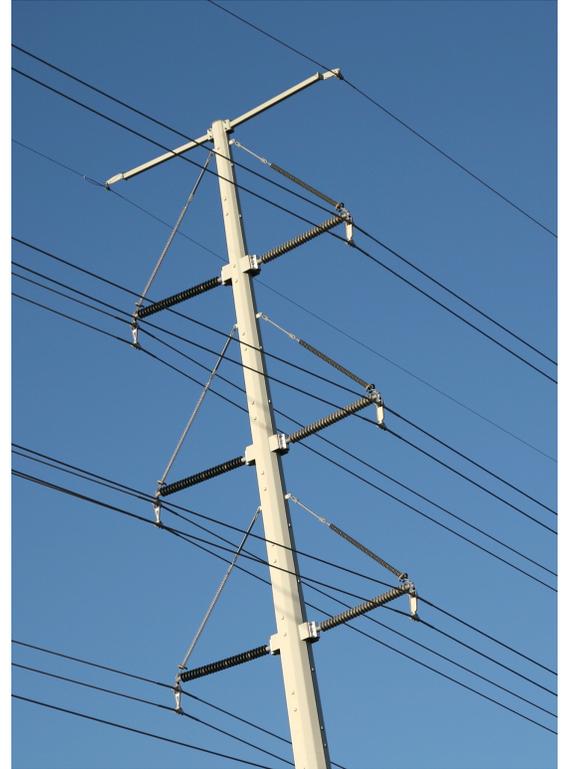

Polymer Braced Post

Guaranteed lifetime performance

Polymer braced post insulators are a type of insulator assembly composed of a line post and a suspension. They offer several advantages over using only a line post or suspension

Some of the key features of polymer braced posts are:

- Reduce ROW: Reduces the distance from the line to the pole due to rigid connections
- Increased Tower Span: Higher load capacity allows for more distance between towers
- Higher Strength: Capacity of braced post is higher than a line post alone due to utilizing the suspension's strength
- Customizable Design: Manufacturers can tailor the design to meet specific mechanical, electrical, and environmental requirements.

Type	Post Section Length (mm)	Leakage (mm)	Tower End fitting	Line End fitting
BP	2432	6670	D	A
BP = Braced Post	Rounded to nearest mm	Rounded to nearest mm	A = Cast curved B = Cast Flat C = Stud Base D = Bendable Gain Base F = Bendable Flat Base	A = Drop Tongue B = Extended Drop Tongue SP = Special Fitting

VICTOR INSULATORS, INC.

The original insulator manufacturer in North America

Polymer Braced Post

Guaranteed lifetime performance

- Increased strength capacity compared to line post alone
- Reduces ROW compared to suspension insulator alone
- Made with high quality hydrophobic silicone polymer
- Lightweight
- Easy installation
- Customizable; size, shape, and bracing arrangements
- Monolithic silicone coating, protects against pollution
- Customized configurations and other assembly types available
